FALSE CEILING SYSTEM

Gypsum false ceilings, also known as gypsum board or drywall ceilings, are a popular and versatile choice in interior design. Composed of calcium sulfate dihydrate, gypsum is used to create lightweight panels for false ceilings. Installed easily onto metal or wooden frameworks, these ceilings offer diverse design options and accommodate various finishes.

Concealing lighting fixtures, they enhance aesthetics and are fire-resistant, contributing to safety in commercial and residential spaces. With commendable acoustic properties, they aid sound insulation. Low maintenance and cost-effectiveness make gypsum false ceilings widely preferred for creating modern and stylish interiors in residential, commercial, and institutional buildings.
